1. Executive Summary

Investment Thesis: Hedge Edge operates a deterministic prop firm hedge arbitrage model where challenge fees are treated as insured cost stacks. By simultaneously taking opposing positions on a funded prop firm account and a personal hedge account, the trader guarantees passing every challenge phase. The expected value (EV) is the funded payout minus the total hedge cost (fee + accumulated hedge losses across all phases). This document analyses the current portfolio of three funded accounts, develops a cash extraction strategy, and proposes a risk-adjusted next portfolio targeting ≥$25K account sizes from a universe of 583 challenges.

Key Findings:

- Current portfolio holds 3 funded accounts with $80,000 in notional exposure.
- Liquid cash on hand: $625
- Total sunk cost across holdings: $1,344.69
- The FundingPips accounts (10% max DD, 80% split) offer superior EV extraction potential vs. the Finotive account (6% DD, 70% split).
- Extracting first payouts from existing funded accounts is the highest-priority action to generate deployment capital.
- The hedgeable challenge universe contains 279 positive-EV opportunities at ≥$25K size.
- Optimal next-portfolio targets $100K-$120K 2-Step challenges (Audacity Capital, AquaFunded, Blue Guardian) for best capital efficiency at current budgets.

2. Current Portfolio Assessment

2.1 Holdings Overview

Account	Firm	Size	Max DD%	Daily DD%	Split%	Status	Sunk Cost	DD Type
FundingPips 25K Funded #1	FundingPips	$25K	10%	5%	80%	Funded	$485.22	Balance/Equity - Highest at EOD
FundingPips 25K Funded #2 (Scaled to 30K)	FundingPips	$30K	10%	5%	80%	Funded (Scaled)	$485.22	Balance/Equity - Highest at EOD
Finotive 25K Instant Funded	Finotive Funding	$25K	6%	3%	70%	Instant Funded	$374.25	Balance Based

Portfolio Summary:

Total notional exposure: $80,000

Total sunk cost (hedge costs + fees): $1,344.69

Liquid cash: $625

Total capital deployed + liquid: $1,969.69

2.2 Portfolio Valuation & Cash Extraction Potential

Each funded account represents a perpetual option on future payouts. The value of each position is determined by the expected payout per cycle minus any residual hedge cost. Since accounts are already funded, the sunk cost is irrelevant for forward-looking decisions — only the marginal EV of the next payout matters.

Account	Acct Size	8% Payout	Split	Net Payout	Payout Timing
FundingPips 25K Funded #1	$25K	$2,000	80%	$1,600	Weekly (60%), Bi-weekly (80%), Monthly (100%)
FundingPips 25K Funded #2 (Scaled to 30K)	$30K	$2,400	80%	$1,920	Weekly (60%), Bi-weekly (80%), Monthly (100%)
Finotive 25K Instant Funded	$25K	$2,000	70%	$1,400	On demand, then every 14 Days

Total potential first-payout extraction: $4,920

This represents the maximum cash extractable if all three accounts hit their 8% funded profit target.

3. Cash Extraction Action Plan

3.1 Funded Account Liquidation Strategy

Recommended Plan: Hedge FP vs Finotive Guaranteed + Trade Remaining

Hedge FundingPips #1 against Finotive to guarantee one side winning. The winning side pays out, the losing side either survives or becomes the sacrificial account depending on direction, and the remaining FundingPips accounts are then traded for additional extraction.

3.2 Projected Liquid Capital

Plan Detail:

- Hedge FP #1 long vs Finotive short (or vice versa):
  - If FP wins: $1,440 payout, Finotive loses ~$1,500 (breaches)
  - If Finotive wins: $1,050 payout (70% × $1,500), FP loses $1,500 but has $2,500 DD buffer (survives)
- Guaranteed minimum extraction: $1,050 (Finotive wins) to $1,440 (FP wins)
- Then trade remaining FP accounts for additional extraction
- Total liquid: $1,440 + $625 = $2,065

4. Market Opportunity Universe

4.1 Hedgeable Challenge Landscape

Universe: 309 hedgeable challenges at ≥$25K account size across the scraped database.

• Positive EV: 279 challenges

• Negative EV: 30 challenges

• Average EV (positive only): $4,073

• Median total hedge cost: $1,885

Account Size	Count	Avg EV	Best EV	Avg THC
$25K	62	$797	$1,371	$811
$30K	1	$1,232	$1,232	$568
$50K	70	$1,830	$2,594	$1,368
$60K	1	$2,810	$2,810	$790
$100K	81	$3,996	$5,727	$2,366
$120K	1	$5,867	$5,867	$1,333
$150K	2	$7,291	$7,385	$2,909
$200K	43	$8,484	$11,319	$4,446
$240K	1	$11,709	$11,709	$2,691
$250K	3	$7,958	$10,782	$6,042
$300K	6	$14,029	$15,370	$5,971
$400K	6	$15,929	$19,395	$10,737
$500K	2	$15,264	$20,242	$16,736

4.2 Risk-Adjusted EV Rankings (Top 25)

Ranked by absolute EV. Total Cost = fee + hedge losses (from database total_hedge_cost column). Cap Eff = EV / Total Cost.

#	Firm	Size	Steps	Fee	Total Cost	EV	Cap Eff	BE%	Max DD%	Split%	Rating

5. rEV Scenario Analysis

Each scenario models the available budget (liquid cash after extraction) against the Total Cost from the database (fee + hedge cost combined). Only challenges where Total Cost ≤ budget are eligible. rEV = risk-adjusted EV incorporating firm quality ratings and payout reliability.

5.1 Conservative Scenario — $625 Budget (Current Cash Only)

If no extraction from funded accounts. Only current liquid cash available.

Firm	Size	Steps	Fee	Total Cost	EV	Cap Eff	Split%	Rating
AquaFunded	$25K	2 Steps	$125	$429	$1,371	3.19x	90.0%	4.3
Blue Guardian	$25K	2 Steps	$141	$454	$1,246	2.74x	85.0%	4.4

Eligible challenges within $4,195 Total Cost: 165

6. Proposed Portfolio Construction

6.1 Portfolio Design Principles

- $25K minimum account sizes — smaller accounts have disproportionate fees relative to EV.
- Firm diversification — immediate deployment should span at least two firms; scaled deployment should span at least three firms where budget allows.
- Drawdown type diversification — favour static or highest-at-EOD structures; avoid concentrations in weaker rule sets.
- Size discipline — Portfolio A should use same-size legs; Portfolio B should stay within a tight size band so the basket remains operationally balanced.
- Capital efficiency optimisation — target portfolios whose aggregate EV remains materially above total hedge cost, not just the best single-leg candidate.
- Payout speed preference — favour faster payout schedules when two candidates are otherwise close on EV and risk.
- Positive EV only — never deploy capital into negative-EV structures even if fee-only affordability looks attractive.

6.2 Recommended Portfolios

The construction below separates the immediate deployable book from the higher-capital follow-on book. Portfolio A is intentionally same-size and multi-account; Portfolio B is the fuller diversified scale portfolio; Portfolio C remains the concentration alternative.

Portfolio A — Immediate Budget ($2,065): Two-Account Equal-Size Starter Pair

Deploy into two matched $50K two-step accounts so hedge sizing stays symmetrical and the first reinvestment book is not dependent on a single counterparty.

Why this pair: it is the strongest practical same-size immediate basket that keeps execution simple, preserves diversification, and still produces meaningful aggregate EV.

Portfolio B — Upside Budget ($4,195): Three-Account Diversified Growth Book

Deploy into three higher-EV legs sized $100K / $100K / $120K. This keeps the basket inside the 2.5x size rule while spreading firm risk across three counterparties.

Why this basket: it materially improves aggregate EV over the current Portfolio B while also making the section visually and analytically complete.

Portfolio C — Concentrated Alternative ($4,195 Upside Budget)

Use one $300K high-EV leg only if simplicity and concentration are preferred over diversification.

Why keep it: it remains the clean benchmark for maximum single-position EV, but it is no longer the recommended default construction.

6.3 Portfolio Construction Matrix

Portfolio	Leg	Firm	Size / Steps	Fee / Total Cost	EV	Construction Note
A	1	Blueberry Funded	$50K | 2 Steps	$225 / $773	$2,427	14D payout, same-size leg
A	2	Maven	$50K | 2 Steps	$220 / $840	$2,360	10BD payout, same-size leg
A	Total	2 accounts	Matched $50K pair	$445 / $1,612	$4,788	Budget left $453 | Agg CE 2.97x
B	1	AquaFunded	$100K | 2 Steps	$429 / $1,473	$5,727	90% split anchor
B	2	FundedElite	$100K | 2 Steps	$299 / $1,274	$5,126	Highest-CE 100K leg
B	3	Audacity Capital	$120K | 2 Steps	$540 / $1,333	$5,867	15% DD buffer
B	Total	3 accounts	$100K / $100K / $120K	$1,268 / $4,080	$16,720	Budget left $115 | Agg CE 4.10x
C	1	FundedElite	$300K | 2 Steps	$899 / $3,830	$15,370	Maximum single-leg EV
C	Total	1 account	$300K concentration	$899 / $3,830	$15,370	Budget left $365 | Agg CE 4.01x

The table below lists each recommended leg plus the aggregate portfolio economics for the immediate, scaled, and concentrated builds.

Recommendation: execute Portfolio A immediately because it satisfies the same-size multi-account requirement and keeps the first redeployment basket disciplined. Upgrade to Portfolio B once additional FundingPips extraction lands, because the three-leg 100K / 100K / 120K structure delivers the best mix of EV, diversification, and balanced sizing. Keep Portfolio C as the concentration alternative rather than the base case.

7. Risk Management Framework

Firm Counterparty Risk: Prop firm may delay payouts, change rules, or close operations.

Mitigation: Diversify across 2+ firms. Prefer firms with >100 reviews and >4.0 rating. Monitor Discord/Trustpilot for early warning signals.

Drawdown Type Misclassification: Database may misclassify trailing as static or vice versa.

Mitigation: Verify drawdown type on firm website before deploying capital. Never deploy into intraday equity trailing.

Hedge Execution Risk: Slippage, spread widening, or disconnect during simultaneous trade execution.

Mitigation: Use limit orders on both sides. Maintain 1.5× margin buffer. Trade during high-liquidity London/NY overlap.

Capital Lock-Up Risk: Funded account payouts may take 14-30 days, reducing redeployment speed.

Mitigation: Prioritise firms with daily/on-demand payouts. Factor payout timing into cash flow projections.

Rule Change Risk: Firms may alter profit targets, splits, or drawdown rules after purchase.

Mitigation: Screenshot and archive terms at time of purchase. Only deploy into established programs.

Concentration Risk: Over-allocating to a single account size or drawdown type.

Mitigation: Current portfolio already spans - across 2 firms. Next portfolio should target different firm and/or - tiers.

8. Implementation Roadmap

Phase 1 — Cash Extraction (Week 1-2)

- Execute the guaranteed FundingPips #1 vs Finotive hedge plan.
- Use Finotive as the deliberate counterpart / sacrificial leg of the guaranteed hedge.
- Target: Generate $1,440 minimum liquid cash from the first guaranteed extraction.
- Then trade the remaining FundingPips accounts for additional extraction.

Phase 2 — Portfolio Selection (Week 2-3)

- Once first payout clears, assess total liquid capital.
- Run updated scraper to refresh challenge data: python Business/STRATEGY/executions/propmatch_scraper.py --action scrape-challenges
- Rebuild model database: python Business/STRATEGY/executions/build_model_input_db.py
- Re-run EV model with latest data.
- Select portfolio based on available budget (A, B, or C from Section 6).

Phase 3 — Deployment (Week 3-4)

- Purchase selected challenge(s) using PropFirmMatch discount codes where available.
- Set up hedge accounts with appropriate margin and buffer.
- Begin simultaneous trading on challenge + hedge accounts.
- Track progress through challenge phases in portfolio tracking sheet.

Phase 4 — Funded Phase & Compounding (Week 4+)

- Upon passing challenge, begin funded phase extraction.
- Reinvest payouts into next round of challenges (compounding).
- Target: Build to 4-6 concurrent funded accounts across 3+ firms.
- Long-term goal: + in total notional funded exposure.

9. Appendix — Full Challenge Database Extract

This appendix now combines all positive-EV hedgeable FX / instant rows at >=$25K from propmatch_challenges.db with hedgeable futures 1-step rows from propmatch_futures_model.db. All $25K and $50K FX / instant candidates are included so they can be added to portfolios directly. Rows are ordered by account size and asset universe. EV for FX / instant rows uses the 8% funded-target convention; futures 1-step rows use the 6% futures convention. Total rows: 210.
